In the 7th and 8th quarters of this contract the focus of work was on the following items:

- 1 Completing the draft technical report on the identification of a spectrum of fires that may occur within a LNG facility, modeling larger LNG fire radiant heat emission and the development of a risk protocol by which the fire models can be considered in a risk analysis.
- 2 Purchasing various instruments and equipment to record (during LNG fire tests) the effectiveness of clothing in reducing the radiant heat effect on people.
- 3 Conducting instrument calibration and other relevant equipment readiness tests for the field experiments.
- 4 Gathering preliminary data from field tests with LNG pit fires conducted over a two day period.
