Delivering Fitness for Service Through Technology – INGAA Technology Development (ITD)

PHMSA/NAPSR Pipeline R&D Forum
July 18 - 19, 2012

Eric Amundsen – Energy Transfer
A multi-year commitment to deliver short and long term technology needs of the industry and enhance our ability to actively manage pipeline integrity:

- Manage a technology R&D roadmap in support of Integrity Management Improvement Initiative (IMCI) efforts
- Enhance existing tools and develop new platforms
- High level of collaboration with PRCI, GTI, NYSEARCH and hazardous liquids pipeline industry to leverage resources and optimize R&D efforts
- Stage gated management and implementation process
- High level of involvement with and communication to stakeholders and technology vendor community to gain acceptance and deploy developed technology
**INGAA Approach To Driving Technology Development**

- Initially for critical technology development needs
  - Matrix of pipe characteristics and threats versus test history defines technology needs
  - High value (safety and business) and time critical R&D in support of Fitness for Service (FFS) assessments
  - Provide clarity and focus for R&D managers and service providers on INGAA’s needs

- Four technology development work stream elements:
  - Regulatory/Standards Development
  - Safety and Business Case Assessment
  - Technology Development
  - Implementation

- INGAA member executive is leading each work stream

- Leadership and engagement needed from R&D Managers, ILI vendors, and integrity services consultants
INGAA Technology Development Goal

• Provide sustainable technology and processes to:

  ▪ Establish and maintain a factor of safety consistent with or greater than that achieved in a pressure test.

  ▪ Create a sustainable new platform of tools to contribute to future management of pipeline integrity.
Advances in ILI technology achieved - gaps remain for gas transmission pipelines

• Progress over the last 15 years:
  ▪ Advanced MFL technology to identify, characterize, and evaluate metal loss anomalies
  ▪ Higher resolution geometry tools to detect and characterize smaller deformations
  ▪ Combination sensors yield more robust capability to detect and better characterize anomalies
  ▪ Robotic platforms for “unpiggable” pipelines

• Technology gaps remain:
  ▪ Detection and characterization of cracks and crack-like anomalies:
    – Surface and non-surface breaking
    – Anomalies coincident with longitudinal weld seams and girth welds and other potential interacting threats
  ▪ Identifying, modeling and quantifying external forces such as soil movement and subsidence
Current focus on pressure testing pipelines that are lacking records & ILI technology

The pipeline incident at San Bruno and other events are helping to drive the focus and effort:

- Pipeline Safety Act reauthorization provisions regarding pipeline records and validation of MAOP of pre-regulation pipe
- PHMSA Advisory Bulletins regarding records verification and plans to establish regulations for pressure testing of pre-regulation pipelines
- NTSB recommendation to pressure test all previously untested pipelines, eliminate the grandfather clause, and make all lines piggable
- NTSB San Bruno report recommendation P-11-32 to INGAA & AGA to report progress and timeline for technology improvement
INGAA proposed a FFS process specifically applicable to pre-regulation pipelines

- Pre-regulation pipelines comprise two-thirds of the gas transmission on-shore mileage (≈179,000 miles)
  - Estimates are 70 to 100K miles of untested pipe
- The INGAA FFS process prescribes a rigorous evaluation for those pipelines lacking traceable, verifiable, and complete test records.
- Provides assessment/mitigation alternatives that are dependent on the pipeline's characteristics:
  - Pressure test to 1.25 x MAOP
  - Run ILI that identifies and characterizes long seam and pipe body anomalies – seeking “alternative technology” acceptance
  - Reduce pressure
  - Replace pipe

http://www.ingaa.org/File.aspx?id=18072 - INGAA FFS One-Pager
Near-term technology priority is to support FFS assessment for pre-regulation pipe

• Joint Industry R&D Project - verify pipe material properties
  ▪ Diameter, wall thickness, seam and possibly gross differences from expected grade (as might be derived from magnetic permeability)
  ▪ Phase 1 jointly funded by AOPL/API and INGAA member companies
  ▪ PRCI is managing the project and companies are engaged

• ITD R&D Roadmap is enabled by the PSA reauthorization and PHMSA Advisory; both support alternative technologies
  ▪ Development of alternative technologies such as ILI will take advantage of the additional information gained from ILI as compared to pressure testing
  ▪ Integrated into the INGAA FFS process for pre-regulation pipelines

• GTI Project – Inspection Technology Strategy Tool
  ▪ Leverages knowledge and data sets from 3 industry projects
Long-term focus is a new set of tools to support integrity management

• Technology development focus:
  ▪ Sensors to identify & characterize injurious pipe body and weld seam features
  ▪ ILI platforms to deliver sensors to the pipeline
  ▪ Defect characterization through analytics/signal processing and tools for “in the ditch direct measurement”
  ▪ Metal loss, dents, crack and crack-like feature evaluation including integration and assessment of interacting threats

• Lead to improvements that continue to enhance the ongoing management of integrity threats

• Will enable INGAA’s goal of zero incidents
Thank You
